

ENERGY CONSULTANCY

Introduction

In a global context undergoing a permanent evolution, companies and organisations from the energy sector face challenges affecting their strategy and organisation policy. They must manage new constraints and be in a position to exploit new opportunities.

Examples of new constraints and opportunities are an increasingly complex legislation, the liberalisation of the electricity and gas markets, the diversification of the energy sources, the development of renewable energies, the public service obligations (PSO) and the protection of the environment.

VAN DIJK MANAGEMENT CONSULTANTS has more than 25 years experience as consultants in the fields of energy and environment, information technologies and research and development services. It answers the needs of companies and organisations by offering highly professional services backed by expertise in all facets of strategy, management and organisation.

Our clients are public and private companies as well as institutions such as the European Commission, state and regional authorities, community and inter-community administrations. Our approach takes always into account the missions, tasks and specific background of the client.

The quality of our approach is furthermore ensured by the application of an internal manual, developed for our ISO 9001 certification.

Services offered

➤ *Studies and analysis*

- Economic and statistical studies in the energy fields.
- Sectorial studies using, in particular, European or worldwide benchmarking methods.

- Studies of issues linking energy and environment (energy efficiency, renewable energies, waste recovery,...).

➤ *Management and energy*

- Policy, management and organisation of the structures.
- Investment feasibility analyses.
- Drawing-up of business plans and procedural and reporting systems.

➤ *Liberalisation and regulation*

- Study of all aspects of the liberalisation of the electricity and gas markets (separation of activities and financial accounts, return on capital, regulatory systems, public service obligations).
- Establishment of tariff structures and levels.

➤ *Assessment of research programmes*

- Impact studies on short or long-term programmes and research projects.
- Management of research projects and monitoring of externalised research.

➤ *Information management*

- Collection of data related to the energy sector (standards, legislation, technical documents, reports and studies) and strategic monitoring.
- Organisation of the information (archive centres, databases and management of documentation).
- Knowledge and content management.
